

Summary Information

Measurement of Air Volume and Static Pressure

Determination of the air performance curves is obtained by using the double chamber method based on AMCA standard. The difference between the pressures before and after the nozzle (differential pressure P_n) is measured to obtain the air flow at the nozzle and the different pressures between those in the two chambers (static pressure P_s). The air flow is calculated from the differential pressure by using equation (A). The auxiliary blower cancels out the aerodynamic resistance.

$$Q = 60 AV \dots (A)$$

Where

Q : Air flow rate (m^3/min)

A : Nozzle sectional area $=F/4 D^2 (m^2)$

V : Average flow velocity from nozzle

$$= \sqrt{2 \frac{P_n}{r}} (m/s)$$

r : Specific gravity (kg/m^3) of air ($r=1.2kg/m^3$ at $20^\circ C$, 1 atm)

g : Gravitational acceleration $= 9.8m/S^2$

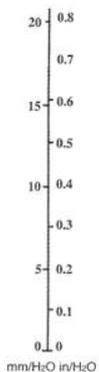

P_n : Differential Pressure (mm H_2O)

P_s : Static pressure (mm H_2O)

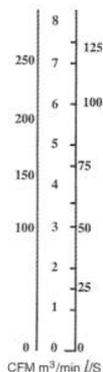

Maximum air flow: When opening the nozzle and absorbing the air using the auxiliary blower to make the static pressure zero ($P_s=0$), the differential pressure (P_n) between chamber A and chamber B will be at it's maximum. The air flow obtained by applying the differential pressure (P_n) to the above equation can be called the maximum air flow.

Maximum static pressure: As shown in the figure, when closing the nozzle, the pressure in the chamber A will be at it's maximum. This differential pressure (P_s) between the air pressure and the pressure in the chamber A can be called the maximum static pressure.

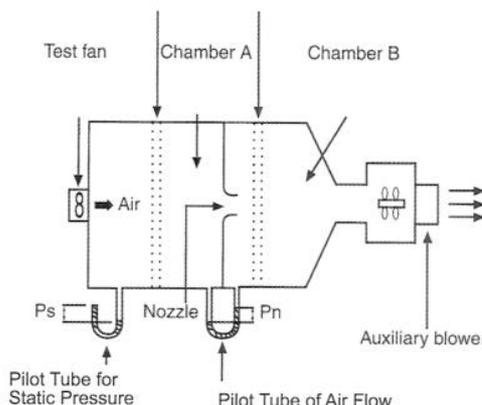

The Static Pressure Conversion Chart

The Airflow Conversion Chart

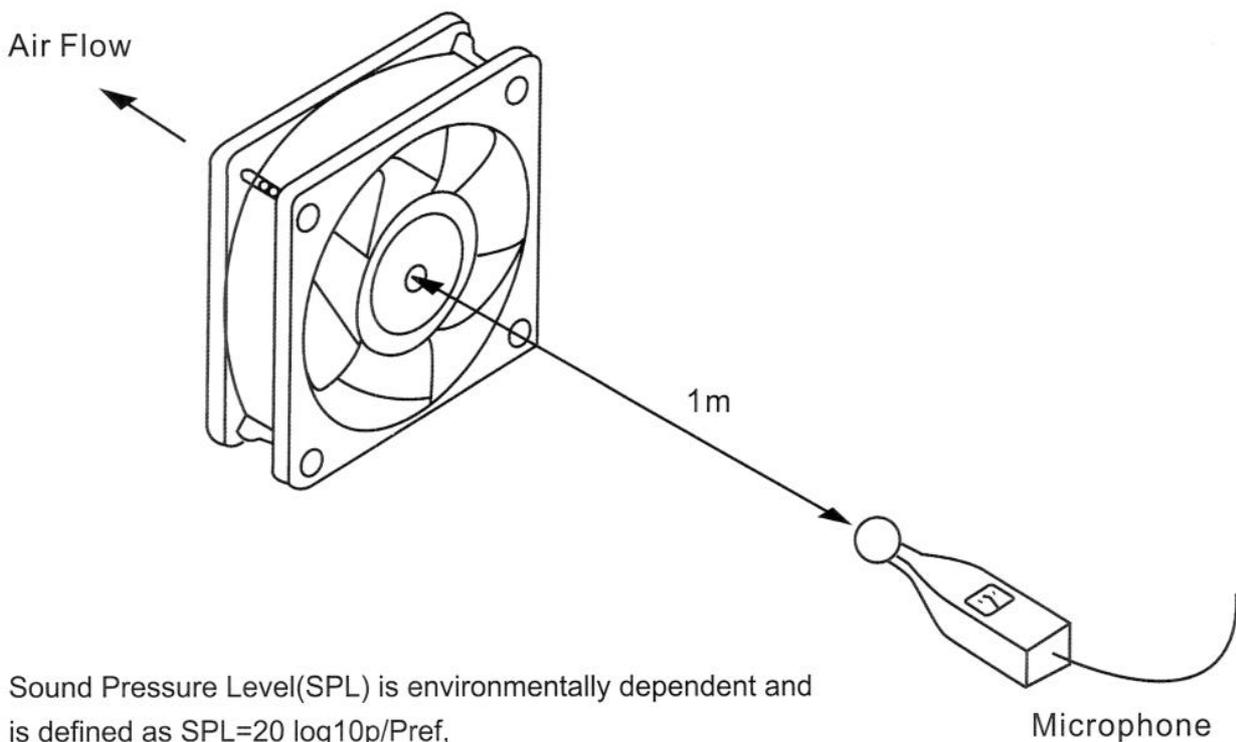

The Measuring Method-double Chamber

Summary Information

Noise Level Data

The Measurements of noise levels are made in accordance with CNS 8753 (which is very close to DIN 45635) ,which is being tested in a sound proof chamber with a sound level $L_p < 15\text{dBA}$. A elastic mounts supported microphone is placed 1 meter from the center line of the fan during the test. The fan is running without any resistance to airflow.

Sound Pressure Level(SPL) is environmentally dependent and is defined as $SPL = 20 \log_{10} p / P_{ref}$,
and Sound Power Level (PWL) is defined as $PWL = 10 \log_{10} W / W_{ref} \dots\dots$

P=Pressure

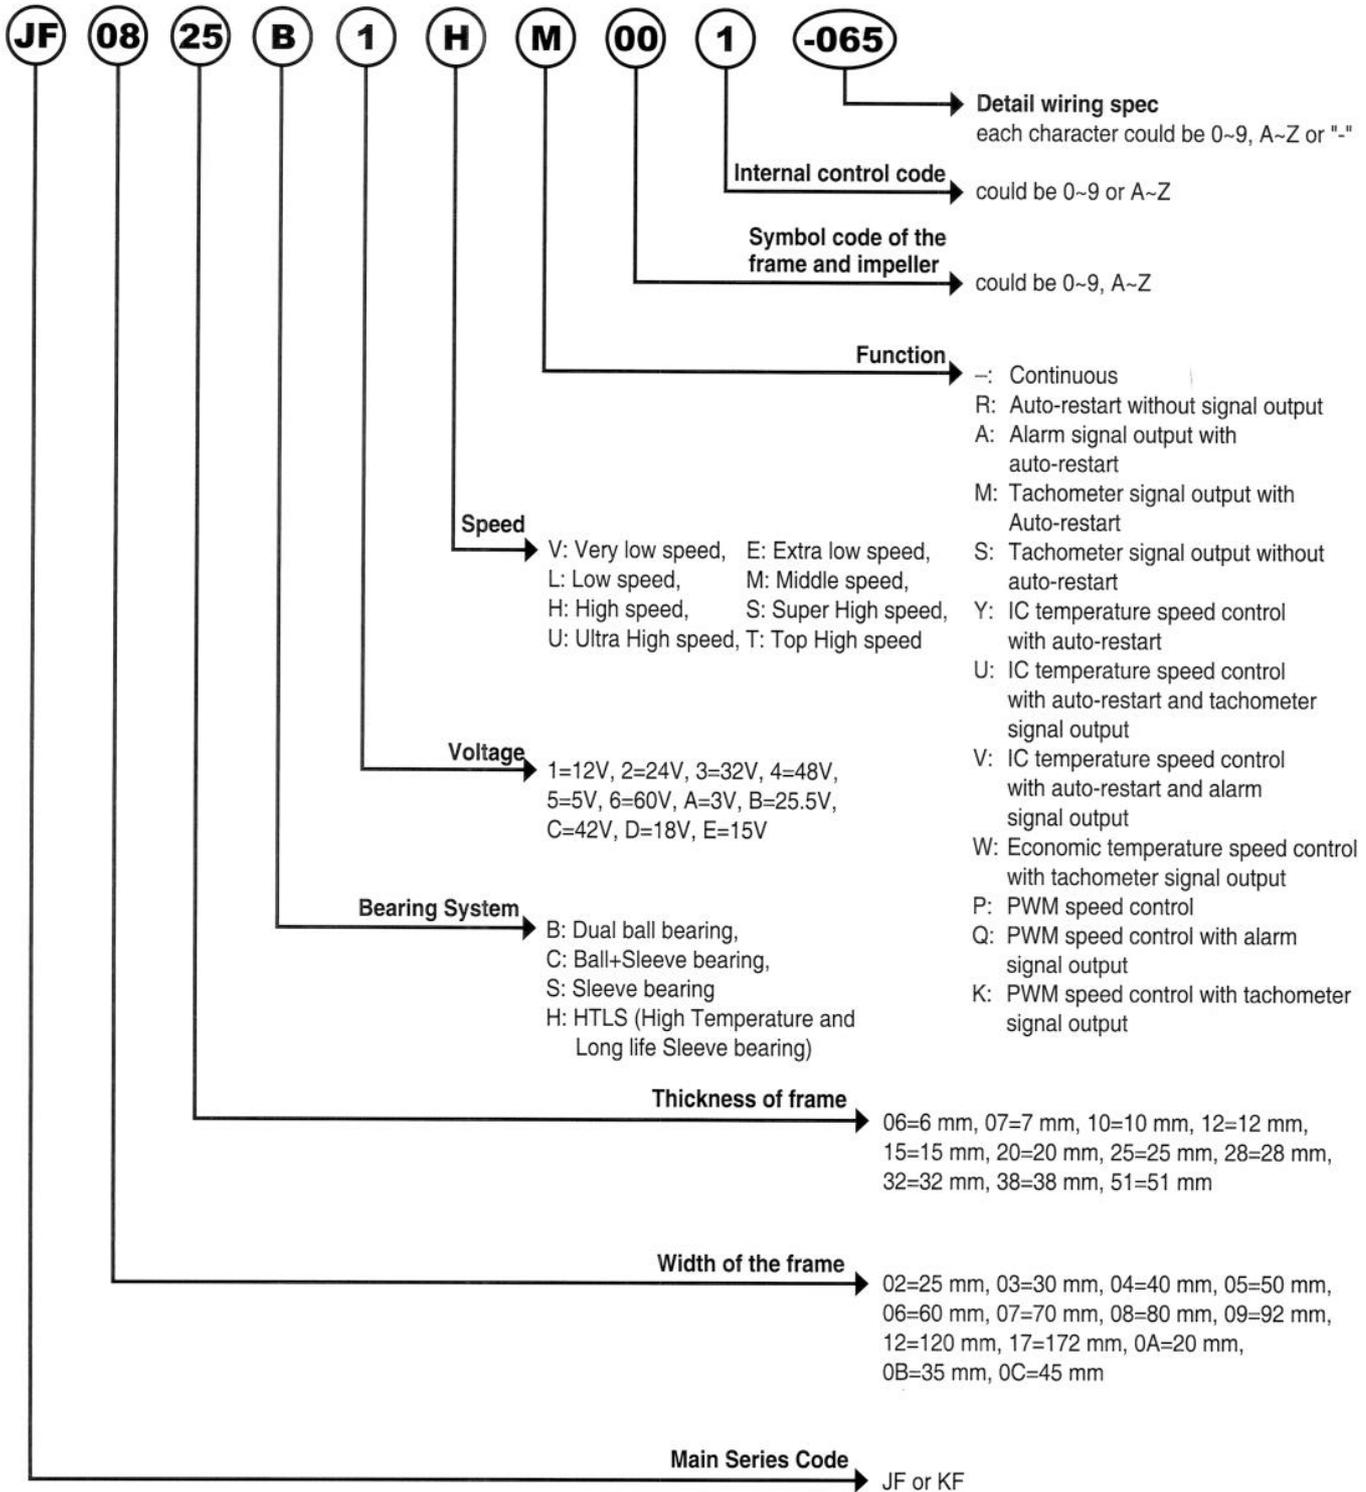

P_{ref} =A reference pressure

W=Acoustic power of the source

W_{ref} =An acoustic reference power

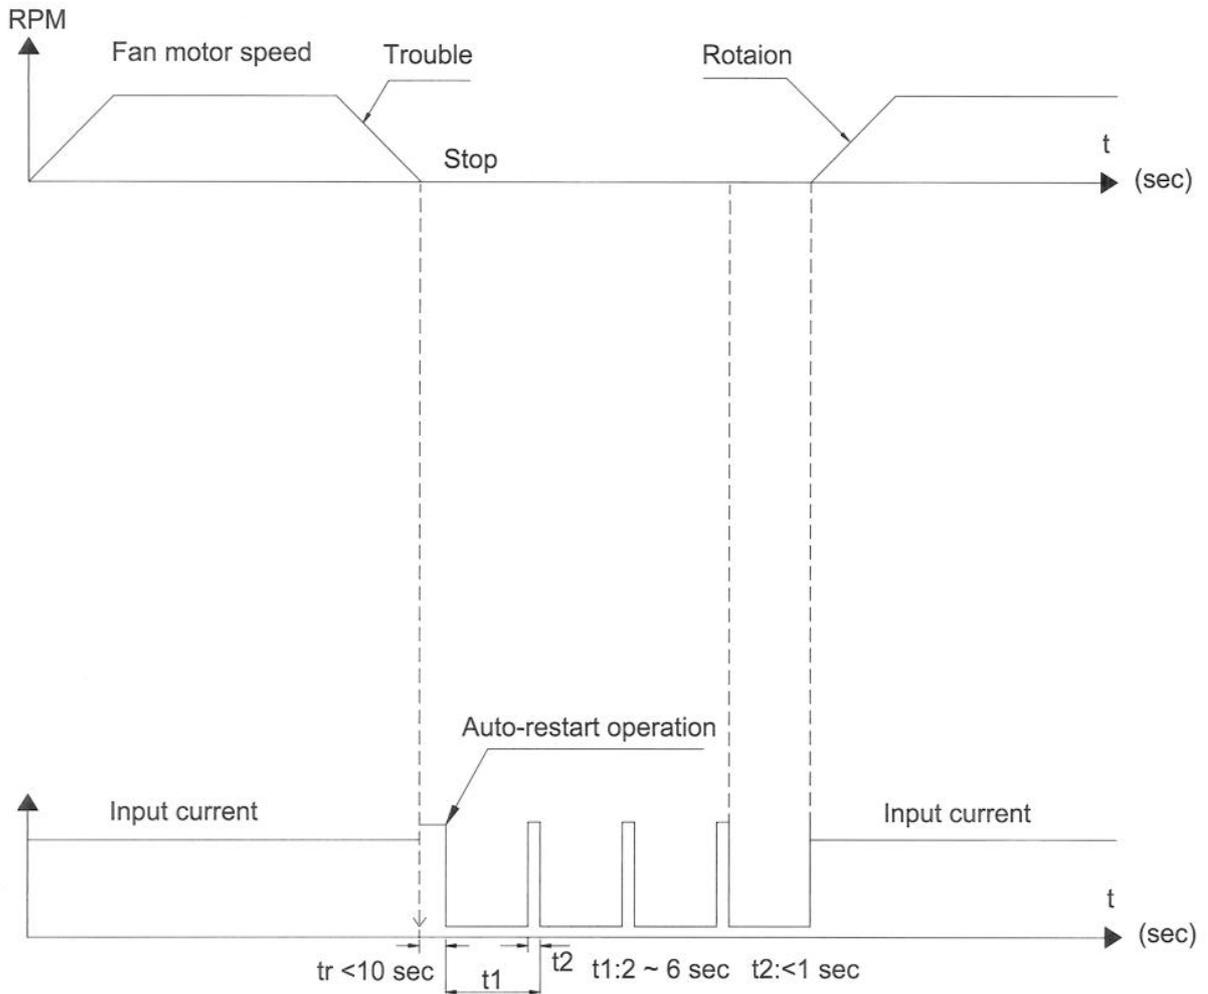

Fan noise data is usually plotted as Sound Pressure Level against the octave frequency bands.

General Specifications

1. Operating Temperature : -10°C~70°C (Ordinary humidity)
2. Storage Temperature : -40°C~70°C (Ordinary humidity)
3. Insulation Resistance : 10M Ohm at DC 500 V.
4. Dielectric Strength : AC 700 V for 3 sec (<0.5 mA allowable, between lead and housing).
5. Life: at ambient temperature 25°C and humidity 65%
 - Dual Ball bearing : 50,000 hours
6. Locked Rotor Protection: designed to meet UL, CUL and TUV.
7. Polarity protection: Reverse connection at the rated voltage will not cause any damage.
8. Insulation Class : UL Class A
