The extensive range of output modules and options make it possible to achieve almost any combination of Volts and Amps. You can create your own NV-350 or NV-700 configuration online at [www.nv-power.com](http://www.nv-power.com). This method checks your configuration and offers the optimum solution. Alternatively, you can do this manually by using the guide below.

1. Calculate total output power to ensure power requirements are within 350 W or 1150 W, then select required Cooling, Connection and Controls/Signals from the table above.
2. Select Output Modules from the Module Tables below ensuring that no more than 6 slots (NV-350) or 8 slots (NV-700) in total are used.

Example – if you require 13 V 20 A:

- a) select B as closest match for voltage & current and prefix with voltage eg. **13BH**
- b) repeat for other outputs

This will create a complete product description eg. **NV3SSSE5V 13BH 12/15DB** which represents a three output NV-350 with Forward air cooling, Screw input terminals, standard leakage filter, ac good, PSU enable & 5 V / 2 A aux supply

Output 1 = 13 V / 20 A  
 Output 2 = 12 V / 13 A with screw terminals  
 Output 3 = 15 V / 4 A with screw terminals  
 Max. 350 W continuous output power

3. Contact TDK-Lambda to validate configuration and issue a part number.

The extensive range of output modules and options make it possible to achieve all popular combinations of Volts and Amps. The “online” configurator is the best way to achieve the optimum configuration, however you can also create your own VEGA configuration from this datasheet by using the guide below.

## Web Configurator

1. Visit the TDK-Lambda website, select “VEGA Configurator” and follow the online instructions.
2. Enter your required Volts / Amps, and any additional functions (if required)
3. Enter preferred type of cooling, input connection, lower leakage current (if required) and controls & signal functions (if required)
4. Configurator will select the most suitable modules and options and give a unique part number.

## Configuring from Datasheet

1. Calculate total output power to determine VEGA 550 W (560 W at 150 V AC and above) or 750 W (900 W at 150 V AC and above) and select converter, then select required cooling, connection, leakage current and controls/signals from the table above.
2. Select Output Modules and Options from the available Output Voltages Tables.

Example – if you require 5 V / 18 A with output inhibit:

- a) select 5L1S as closest match for voltage and current
- b) add suffix N for output inhibit eg **5L1SN**
- c) repeat for other outputs

Ensure you do not select more than a total of 5 slots width of module.

This will create a complete product description eg:

**V5FSSS 5L1SN 12/12H3/3S 24C5S** which represents a four output 550 W VEGA with Forward air, Screw input terminals, 1.5 mA Earth Leakage, AC Fail, Global Inhibit & 5 V / 100 mA aux supply.

Output 1 = 5 V / 35 A with output inhibit, Module Good and Current Share option

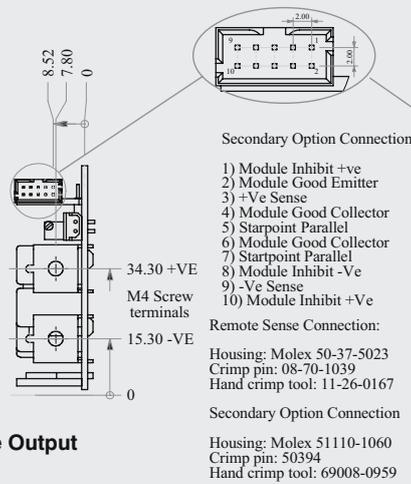

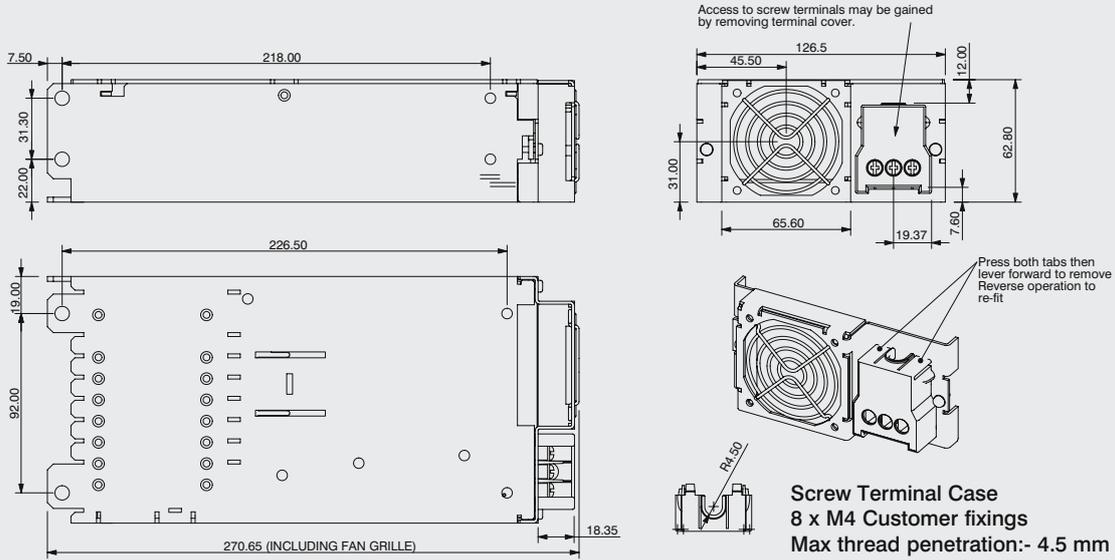

Output 2 = 12 V / 10 A

Output 3 = 12 V / 6 A

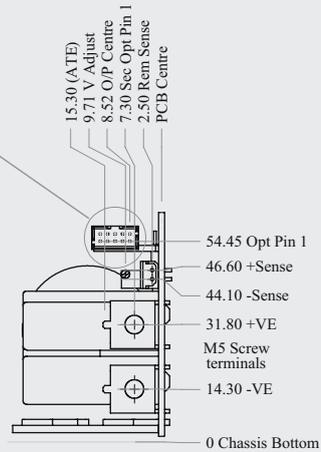

Output 4 = 24 V / 10 A

3. **Contact TDK-Lambda to validate configuration and issue a part number.**

3. Enter preferred type of cooling, input connection, lower leakage current (if required) and controls & signal functions (if required).
4. Configurator will select the most suitable modules and options and give a unique part number.

Notes: a) Not available for VEGA 900. b) Thermocoupled sample recommended to ensure adequate cooling – consult sales. c) xFW and xEW options increase leakage current by 90 µA. Replace “x” with required output voltage (5FW = 5 V aux supply). d) Not available for VEGA DC.

### Configuring from Datasheet

1. Calculate total output power to determine VEGA 450 W, 650 W or 900 W and select converter, then select required Cooling, Connection, Leakage Current and Controls / Signals from the table above.
2. Select Output Modules and Options from the Output Voltages tables.
  - Example – if you require 5.2 V / 18 A with output inhibit:
    - a) select B1H as closest match for voltage and current and prefix with voltage (eg **5.2B1H**)
    - b) add suffix S or F for Screw or Fast-on connection (eg **5.2B1HS**)
    - c) add suffix N for output inhibit (eg **5.2B1HSN**)
    - d) repeat for other outputs

Ensure you do not select more than a total of 5 slots width of module. This will create a complete product description eg:

**V5FSSF 5L1SN 12/12H3/3S 24C5S** which represents a four output 650 W VEGA with Forward air, Screw input terminals, 1.5 mA Earth Leakage, AC Fail, Global Inhibit & 5 V / 100 mA aux supply with the following outputs:

- Output 1 = 5 V / 35 A with output inhibit, Module Good and Current Share option
- Output 2 = 12 V / 10 A
- Output 3 = 12 V / 6 A
- Output 4 = 24 V / 10 A

3. Contact TDK-Lambda to validate configuration and issue a part number.
